The global DC Magnetron Sputtering Coater market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

DC magnetron sputtering coater is a type of thin film deposition equipment that uses a high-voltage, direct current (DC) power source and a magnetron target to create plasma in a vacuum chamber. The target material, usually a metal, is bombarded by plasma ions and the resulting atoms or molecules are deposited onto a substrate to form a thin film. The advantage of using DC magnetron sputtering over other methods is that it can achieve a high degree of control over the deposited film's quality, thickness, and uniformity, and can also be used with a wide range of target materials and substrates.
