The global DC Motor Commutator market size is predicted to grow from US\$ 2113 million in 2025 to US\$ 2924 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

In 2025, global sales of DC motor commutators reached 1.2 billion units, with an average selling price of \$1.8 per unit. A DC motor commutator is a key conductive component installed on the rotor of a DC motor. Its core function is to achieve periodic switching of current direction through contact with carbon brushes, generating a continuous rotating magnetic field in the armature windings, thereby ensuring stable motor operation. This product typically consists of copper commutator segments, insulating materials, and steel bushings, formed into a single assembly through precision stamping, insulation pressing, and high-precision machining. It features good conductivity, strong wear resistance, and stable high-temperature performance, and is widely used in DC motor systems in automotive motors, home appliances, power tools, industrial automation equipment, and rail transportation equipment. Upstream raw materials mainly include electrolytic copper, phenolic resin insulating materials, steel, and precision machining auxiliary materials. Upstream suppliers are primarily non-ferrous metal smelting and engineering plastics companies. The global industry's total production capacity is approximately 1.5 billion units, with an average gross profit margin of approximately 18%. With the continued growth in automotive electrification and demand for small motors, commutators maintain stable demand in areas such as automotive starter motors, wiper motors, and seat adjustment motors. Meanwhile, high-precision miniature commutators still have room for growth in the fields of smart home appliances and power tools. Industry opportunities are mainly concentrated in the areas of high wear-resistant materials, automated production, and high-reliability product upgrades.
