Solid state relay module is a non-contact electronic switch. It consists of discrete components, a thin film fixed resistor network, and a chip. By using hybrid technology assembly, electrical isolation and signal coupling between the control circuit (input circuit) and the load circuit (output circuit) have been achieved. Implementing load switching through solid-state devices without the need for any movable internal components. Although there are many types and specifications of solid-state relays on the market, their working principles are basically similar. It mainly consists of three parts: input (control) circuit, drive circuit, and output (load) circuit.
