The global De-SOx Scrubber Systems market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Scrubbers or Exhaust Gas Cleaning Systems (EGCS) are used to remove particulate matter and harmful components, such as sulphur oxides (SOx) and nitrogen oxides (NOx) from the exhaust gasses generated as a result of combustion processes in marine engines, to implement pollution control.

The global market for de-SOx scrubber systems is expected to grow steadily in the coming years. This is mainly driven by increasing regulations on sulfur emissions from power plants and industrial processes. One of the major trends in the market is the shift towards cleaner and more sustainable energy sources. Many countries are adopting stricter environmental regulations to reduce sulfur dioxide emissions, which has led to the implementation of de-SOx scrubber systems in power plants and other industrial facilities. The growing awareness of the harmful effects of sulfur dioxide emissions on human health and the environment has also contributed to the market growth. This has prompted governments and regulatory bodies to impose stringent emission standards and promote the use of de-SOx scrubber systems as a means of reducing pollution. Another trend in the market is the increasing demand for retrofitting existing power plants and industrial facilities with de-SOx scrubber systems. This is driven by the need to comply with emission reduction targets without the need for significant capital investments in new infrastructure.
