The global Dedicated EV Platforms market size is predicted to grow from US\$ 10120 million in 2025 to US\$ 30910 million in 2032; it is expected to grow at a CAGR of 17.6% from 2026 to 2032.

A vehicle platform is a base layer structure, where components such as the body, drive unit, and suspension are built upon or fitted into the platform. Therefore, a dedicated electric vehicle platform is an underpinning that is designed and made from the start for EVs in mind only. Also dubbed 'ground-up', 'skateboard' or 'bespoke' EV architectures, it's designed to accommodate electric drive units, the large battery pack, and other climate control, electronic and battery management systems to yield benefits for drivers and passengers.

The skateboard chassis puts all the power, transmission, walking, and control systems in a flat chassis. The hard connection between the chassis and the steering wheel and pedals in the cockpit is released through wire control technology, so that the cockpit can be freely arranged and designed. In 2002, GM first released the skateboard chassis concept car Hi-wire, which put the hydrogen power system in a flat chassis and used the steering wheel technology to replace the mechanical connection between the steering wheel and the front wheels. The advantages of skateboard chassis, in addition to being suitable for travel scenarios in the era of autonomous driving, also have revolutionary significance for car design and manufacturing. Through the skateboard chassis technology, the development cycle of a complete vehicle can be shortened by 6-12 months. However, templated production will also bring crisis. In the fields of logistics vehicles and engineering vehicles, most of them can share a set of chassis, and only need to add different tops. In the field of passenger vehicles, the chassis is the most The core technology is the competitive advantage of major manufacturers. From

the perspective of enterprise competition, it is not realistic for different manufacturers to use the same chassis. Moreover, the skateboard chassis is similar to a non-load-bearing body structure, which is difficult to meet the needs of higher comfort and driving experience, and the handling performance, NVH, collision protection, and comfort adjustment will all be affected.
