The liquid cooled plate processed by deep hole drilling is an innovative thermal designed specifically for efficient heat dissipation. During the manufacturing process, complex channel structures are precisely machined inside the metal plate using deep hole drilling machines. These channels can be in the form of straight lines, spirals, or other forms, aimed at maximizing the contact area between the cooling liquid and the plate. The design of liquid cooling plates aims to solve the problem of generating a large amount of heat during operation of high-power electronic components, laser equipment, etc. By circulating and pumping cooling liquid, the liquid cooling plate can quickly absorb and conduct heat, achieving efficient heat dissipation. This enables the device to maintain a stable temperature in a continuously high load working environment, ensuring the reliability and durability of device performance.

The global Deep Drilled Liquid Cold Plate market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
