Deep Foundation Diaphragm Wall Slurry Trench Stabilization Polymer is a specialty polymer additive used in diaphragm wall trench excavation to stabilize trench walls, control filtration loss and maintain slurry rheology. It can be used alone or with bentonite-based slurry systems to improve suspension, reduce soil collapse and support excavation in deep foundation works. The product is mainly applied in underground stations, basements, retaining walls, cut-off walls, tunnels and urban foundation projects. The market includes polymer powders, liquid polymers and formulated slurry additives for trench stabilization, but excludes ordinary cement, concrete admixtures and general drilling fluids not used for diaphragm walls.

The industry chain includes water-soluble polymers, acrylamide derivatives, cellulose ethers, stabilizers, dispersants, packaging materials and formulation additives.

Midstream production covers polymerization, blending, drying or liquid formulation, viscosity adjustment, quality testing and packaging. Downstream demand comes from diaphragm wall contractors, foundation engineering firms, subway construction, underground commercial projects, water conservancy works and urban infrastructure projects. Growth is driven by deeper excavations, complex soil conditions, urban underground development, environmental requirements and demand for more stable slurry systems.
