The global Deep Packet Inspection (DPI) market size is predicted to grow from US\$ 8291 million in 2025 to US\$ 33070 million in 2031; it is expected to grow at a CAGR of 25.9% from 2025 to 2031.

Deep packet inspection (DPI) is a form of filtering used to inspect data packets sent from one computer to another over a network. DPI is a sophisticated method of packet filtering that operates at the seventh layer (the application layer) of the Open System Interconnection (OSI) reference model. The effective use of DPI enables its users to track down, identify, categorize, reroute or stop packets with undesirable code or data.

DPI is normally more effective than typical packet filtering, which inspects only the packet headers. DPI inspects the packet's data part (and sometimes the packet header) when it goes over an inspection point, attempting to find protocol noncompliance, intrusions, spam, viruses or other predefined factors to determine whether the packet can pass or whether it must be directed to another location.

With DPI, organizations can boost their network management systems without investing heavily in core network technologies.

Deep packet inspection is also known as complete packet inspection and information extraction.

The major players in global Deep Packet Inspection (DPI) market include Cisco Systems, International Business Machine (IBM), Intel, etc. The top 3 players occupy

about 30% shares of the global market. North America and Europe are main markets, they occupy about 60% of the global market. Integrated DPI is the main type, with a share about 75%. Internet Service Provider is the main application, which holds a share about 40%.
