Defective Microstrip Structure Filter (DMS Filter) is a filter designed based on Defective Microstrip Structure (DMS). Defective microstrip structure filters are filters formed by etching periodic or non-periodic defect structures on metal microstrip lines. These defect structures can change the electromagnetic characteristics of the microstrip line, thereby producing a band-stop effect within a specific frequency range and achieving effective filtering of the signal. The working principle of the DMS filter is mainly based on the influence of the defect structure on the microstrip line on the propagation characteristics of electromagnetic waves. When electromagnetic waves propagate on the microstrip line, reflection, scattering and other phenomena will occur when encountering defect structures, causing changes in the transmission characteristics of the electromagnetic waves. By reasonably designing the shape and size of the defect structure, the transmission of electromagnetic waves can be suppressed within a specific frequency range, thereby achieving a filtering effect.

The global Defected Microstrip Structure Filter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.

As a high-performance miniaturized filter, the Defective Microstrip Structure (DMS) filter has received extensive attention and research in recent years. The DMS filter forms high inductance and high capacitance characteristics by etching a specific shape (such as a T-shaped unit) on the microstrip line, thereby achieving miniaturization and high performance of the filter. With the in-depth study of microwave technology, the design of the DMS filter has been continuously optimized, with more stable performance, lower noise and higher efficiency. With the rapid development of wireless communication technology and the trend of miniaturization and integration of electronic equipment, DMS filters have been widely used in mobile communications, satellite communications, radar systems and other fields due to their superior performance and compact structure. In particular, driven by technologies such as 5G, the Internet of Things, smart homes, and autonomous driving, the demand for filters continues to grow, providing a broad space for the development of the DMS filter market.
