Deferasirox is an oral iron chelator. Its main use is to reduce chronic iron overload in patients who are receiving long-term blood transfusions for conditions such as beta-thalassemia and other chronic anemias.

The Exjade market is driven by the increasing prevalence of iron overload conditions, such as transfusional hemosiderosis in patients receiving regular blood transfusions. Exjade, a medication containing deferasirox, is used to manage iron overload by chelating excess iron and promoting its elimination from the body. The drug's efficacy in preventing iron-related complications has contributed to its growing adoption in the treatment of thalassemia and other transfusion-dependent disorders. Moreover, advancements in medical research and improved patient access have further propelled market growth. However, challenges include the high cost of the medication, potential side effects, and the need for continued research to optimize dosing and monitoring

strategies. Overcoming these challenges and expanding access to affordable and safe treatments will be crucial for the sustained growth of the Exjade market.
