Defoamer for architectural is a reagent used to eliminate bubbles generated by building materials. In the building industry, due to the existence of emulsifier, dispersant, thickener and other additives in the formula, not only a large number of bubbles will be generated, but also bubbles can be stabilized, resulting in a large number of bubbles in building coatings. In the film forming process, if the bubbles cannot disappear, it will cause film shrinkage, pinhole and other defects. Therefore, adding defoamer to eliminate these bubbles can achieve satisfactory results.
