Deformed wire is a versatile medium-sized wire, processed into various cross-sectional shapes beyond the standard round, hexagonal, square, and rectangular forms.

Offering significant cost savings over traditional cutting, grinding, and sheet metal processing, deformed wire can be manufactured through cold drawing or cold rolling. Its benefits include weight reduction, yield improvement, process simplification, enhanced accuracy, and a smoother metal surface.

Deformed wire springs exhibit superior spring properties when their cross-section is altered. Through quenching and tempering, they gain excellent straightness, an expanded elastic limit, and a high yield point, leading to enhanced durability. Deformed wire materials encompass a range of options, including carbon steel, alloy steel, stainless steel, copper and copper alloys, and titanium and titanium alloys.

The global Deformed Wire market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
