The global Dehydrator for Space market size is predicted to grow from US\$ 274 million in 2025 to US\$ 486 million in 2032; it is expected to grow at a CAGR of 8.7% from 2026 to 2032.

Dehydrator for space is a device that plays an important auxiliary role in communication system engineering. It is mainly used in microwave stations, radar stations, satellite ground stations, radio and television transmitters and other scenes to maintain the air pressure in waveguides or feeder systems composed of waveguide devices.

Dehydrator for space is mainly composed of electromagnetic air pump, desiccant, air pressure monitor, main control circuit, display and operation circuit, power supply circuit and inflation nozzle. The electromagnetic air pump generates airflow, which passes through the desiccant to remove the moisture component, and then detects the current inflation pressure through the air pressure monitor, and sends the air pressure value to the main control circuit board. The main control circuit receives the air pressure value, compares it with the predetermined air pressure value, controls the working state of the electromagnetic air pump, and realizes automatic inflation or stops inflation.

The application of new lightweight and corrosion-resistant materials (such as composite materials and special alloys) has improved the durability and environmental adaptability of equipment. The integration of the Internet of Things (IoT), sensors and automatic control technologies enables real-time air pressure monitoring, fault warning and remote maintenance. The introduction of efficient compressors and energy-saving designs reduces energy consumption and meets green environmental protection needs.

Modern radars (such as phased array radars) and military communication equipment have higher requirements for waveguide air tightness, which promotes the development of high-precision and high-reliability inflators. Military applications need to adapt to high

altitude, extreme cold, humid and other environments, driving equipment to improve sealing and stability.

High-frequency communication base stations have increased their dependence on waveguide systems, and inflators need to support higher frequencies and more complex air pressure management requirements. The construction of low-orbit satellites and ground stations has given rise to the demand for lightweight and automated inflatable equipment.
