Dehydrogenated electrolytic manganese is a type of high-purity manganese metal that is produced through an electrochemical process. It is a refined form of electrolytic manganese, which is made by electrolyzing a solution of manganese sulfate and sulfuric acid. Dehydrogenated electrolytic manganese is further processed by removing hydrogen from the metal, resulting in a product with high purity and low levels of

impurities. This material is widely used as an alloying agent in the production of various steel products, as well as in the manufacture of batteries, electronics, and other industrial applications.

The specific properties and characteristics of dehydrogenated electrolytic manganese can vary depending on the specific production process and quality control measures used during manufacturing.
