Dehydrolinalool is an organic compound belonging to the terpene alcohol family, possessing a woody, spicy, and aromatic scent. It is widely used as a fragrance ingredient in perfumes, flavorings, and cosmetics. It is typically produced from linalool through a dehydrogenation reaction and is a natural component of many plants, especially aromatic plants such as the camphor tree. Due to its unique aroma and biological activities such as antibacterial and antioxidant properties, dehydrolinalool is often used in high-end perfumes and skincare products.

The upstream supply chain of dehydrolinalool mainly involves the extraction and production of raw materials, primarily natural plant essential oils such as linalool and camphor oil, which are obtained through distillation or chemical synthesis. The downstream supply chain covers multiple application industries, mainly including the fragrance and flavor industry, cosmetics and personal care products (such as perfumes and skincare products), and some pharmaceuticals and agrochemicals. In these fields, dehydrolinalool is mainly used as a fragrance ingredient, widely employed to enhance the aroma and biological activity of products.
