## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Products for delaying myopia progression mainly include defocus lenses, orthokeratology lenses (OK lenses) and low-concentration atropine eye drops. The defocus lens achieves the effect of delaying the progression of myopia by inhibiting the growth of the eye axis. Orthokeratology lens (OK lens) is a kind of contact lens worn when sleeping at night. Through the surface pressure of the lens and the adsorption force of tears, the curvature of the central part becomes smaller and the curvature of the side center becomes larger, thereby changing the defocus state of the peripheral retina and achieving The effect of inhibiting the increase of eye axis can effectively prevent the rapid progression of myopia for minors whose eyeballs have not yet formed, and can get rid of the shackles of glasses during the day. Concentrated atropine eye drops are still in the stage of clinical trials. The existing atropine eye drops that can be sold in China are licensed by the State Food and Drug Administration for hospital preparations, that is, they can only be sold in hospitals and cannot be sold outside.
