The production process of delayed coking is divided into two steps: coking and decoking: coking is the process in which heavy oil is cracked in the coke tower to generate oil gas and petroleum coke, and decoking is the process in which the petroleum coke generated by coking in the coke tower is broken and discharged. Industrial plants generally have two or four coke drums. Delayed coking equipment occupies an important position in the secondary processing of petroleum. In terms of operation, it has the advantages of continuous operation, large processing capacity, strong flexibility, high decarbonization efficiency, and low investment and operating costs.
