Dementia is the term used to describe the symptoms of a large group of illnesses that cause a progressive decline in a person's functioning.

It is a broad term to describe a loss of memory, intellect, rationality, social skills and what would be considered normal emotional reactions. Dementia causes significant impairment in a person's day to day functioning.

There are no drug treatments that can cure Alzheimer's disease or any other common type of dementia. However, there are medicines for Alzheimer's disease that can ease symptoms for a while, or slow down their progression, in some people.
