The global Denitrification Spray Nozzles market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Denitrification spray nozzles are specialized devices used in industrial processes to reduce nitrogen oxide (NO<sub>x</sub>) emissions by facilitating the denitrification process. These nozzles spray a controlled amount of liquid, typically a reagent such as ammonia or urea, into exhaust gases in boilers, furnaces, or power plants. The liquid reacts with nitrogen oxides in the exhaust, converting them into harmless nitrogen and water vapor, thereby reducing air pollution and meeting environmental regulations. The design of these nozzles ensures efficient atomization of the liquid, allowing for precise distribution and optimal contact with the exhaust gases, enhancing the effectiveness of NO<sub>x</sub> reduction. Denitrification spray nozzles are critical components in Selective Non-Catalytic Reduction (SNCR) and Selective Catalytic Reduction (SCR) systems used for emission control.
