The report requires updating with new data and is sent in 48 hours after order is placed.

The implant system includes implants, implant abutments, and crowns, of which the implant is the core component of the implant. The implant system includes the first-stage surgical implant and the second-stage surgical implant. The abutment of the first-stage implant system and the implant are directly connected as a whole, and the abutment directly extends into the mouth; the secondary implant abutment and the implant are not the same. It is a prefabricated whole, but after the implant and its surrounding bone bed are directly healed, the mucoperiosteal is incised for abutment connection. There is a certain difference in the repair time between the two. One-time cylindrical implants are simpler and less troublesome, and can be completed in one operation. After the sutures are removed, they can be repaired with temporary restorations. After the implants are stabilized for 3 months, the mold can be taken, and a permanent restoration can be completed in a few weeks.
