The global Dental Intra Oral 3D Scanner market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

A dental intraoral 3D scanner is a device used in dentistry to capture detailed three-dimensional images of the teeth, gums, and other oral structures. It is a small handheld scanner that is inserted into the patient's mouth to capture digital impressions of their teeth and gums. The scanner uses advanced optical technology to capture multiple images from different angles and then merges them together to create a comprehensive 3D digital model of the patient's mouth. This technology eliminates the need for traditional dental impressions using messy impression materials. The digital models generated by the dental intraoral 3D scanner can be used for various purposes in dentistry. They allow dentists to accurately diagnose dental conditions, plan treatments, and design customized dental restorations such as crowns, bridges, and aligners. The digital files can also be easily stored, shared, and used for monitoring treatment progress over time. Overall, dental intraoral 3D scanners offer a more efficient, comfortable, and accurate alternative to traditional dental impressions, improving the patient experience and enhancing the precision of dental treatments.
