A dental light-curing unit is a piece of dental equipment that is used for polymerization of light-cure resin-based composites. It can be used on several different dental materials that are curable by light. The light used falls under the visible blue light spectrum. This light is delivered over a range of wavelengths and varies for each type of device. There are four basic types of dental curing light sources: tungsten halogen, light-emitting diodes (LED), plasma arcs, and lasers. The two most common are halogen and LEDs.

The global Dental Light-Curing Units market size is projected to grow from US\$ 242.2 million in 2023 to US\$ 403.8 million in 2030; it is expected to grow at a CAGR of 7.6% from 2024 to 2030.

According to our research, the global market for medical devices is estimated at US\$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing awareness about early disease diagnosis and treatment. Curing lamps are mainly used for the polymerization of light-curable resin-based materials. In the dental industry, curing light machines are an integral part of dental equipment for polymerizing composite materials with light-curing resins. Dental curing lights are an integral part of all dental procedures/specialties. Light energy is used to polymerize nearly all dental adhesives and resin composites, which determines the long-term clinical success of the procedure. Dental infectious disease generally refers to tooth decay, tooth decay or dental caries, is a common oral disease. These lead to demineralization of the organic matter in the teeth. The incidence of dental caries in adults and children is increasing globally. Typically, dentists clean decayed teeth using common treatments such as crowns, root canals, fillings, and extractions. This is expected to boost the market.
