Dental ridge splitting kits are specialized sets of instruments and tools designed specifically for use in dentistry. They are employed by oral surgeons and dentists to surgically split the alveolar ridge, which is the bony ridge that holds the tooth sockets, in order to create additional space for dental implant placement or to reshape the ridge for better prosthetic restoration. This technique involves ridge-splitting and chisel bone expansion, which allows dentists to form the insertion site of the implant without having to remove any bone from the surrounding area. Consequently, this kit provides a great solution for those seeking optimal results with minimal tissue damage.
