The global Dental Scrap Recycling market size is predicted to grow from US\$ 470 million in 2025 to US\$ 673 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

Dental scrap recycling refers to the process of collecting, processing, and recycling waste materials that are generated by dental practices. These materials often contain valuable metals such as gold, silver, palladium, and other precious metals, which are commonly used in dental restorations like crowns, bridges, fillings, and orthodontic appliances due to their durability and ability to withstand the mouth's environment. Dental scrap recycling is a specialized field within the broader scrap metal recycling industry, and it requires specific expertise to handle the materials safely and efficiently. Many dental practices partner with certified recycling companies that are equipped to handle the unique challenges of dental scrap recycling.

The dental scrap recycling industry is experiencing steady growth driven by rising precious metal prices, increasing environmental regulations mandating proper disposal of mercury-containing amalgam, and growing adoption of circular economy practices in dentistry; key opportunities include expanding partnerships with dental service organizations (DSOs), developing advanced separation technologies for mixed metal scraps, and tapping into emerging markets with improving dental infrastructure, while challenges persist in the form of strict regulatory compliance requirements for mercury handling, low awareness among small dental practices about recycling value, and supply chain fragmentation affecting material collection efficiency.
