Dental wax is a mixture of different type of waxes with synthetic additives, used in dentistry for casting, sizing and mapping of structures and jaw relations, laboratory work and as lubricants to relieve friction associated with braces and other dental implants. Dental wax is an opaque hydrophobic material, mostly produced from petroleum and vegetable sources, which softens on being pressed or heated. Self-setting dental waxes are used for the purpose of mapping dental structures during the manufacturing of dental caps and custom sized implants. Softer dental waxes are used to relieve discomfort caused by orthodontic implants such as braces, wires, etc.

Increasing use of dental fixtures and treatments, rising awareness of dental diseases, increasing penetration of dentistry in the healthcare setup of many countries, rising use of dental implants drive the growth of the market. Additionally, positive influence of media and fashion industry on rising dental aesthetics demand and increasing awareness adding fuel to the dental waxes market.
