The global Deoxyadenosine Triphosphate (dATP) Reagent market size is predicted to grow from US\$ 341 million in 2025 to US\$ 673 million in 2032; it is expected to grow at a CAGR of 10.4% from 2026 to 2032.

Deoxyadenosine 5'-triphosphate (dATP) is a crucial nucleotide reagent in molecular biology and biochemistry experiments. It is a deoxyribonucleoside triphosphate (dNTP) structurally composed of an adenine base, a deoxyribose sugar (lacking an oxygen atom at the 2' position), and three linked phosphate groups. The core function of dATP is as a fundamental raw material for DNA synthesis: under the action of DNA polymerase, it, along with three other dNTPs (dCTP, dGTP, and dTTP), is added to the growing DNA strand, providing the phosphodiester bonds needed to form the DNA backbone and releasing pyrophosphate. Therefore, dATP is an indispensable key component in all experiments requiring in vitro synthesis or repair of DNA strands, including PCR (polymerase chain reaction), DNA sequencing, cDNA synthesis, and DNA labeling. Sales in 2025 were projected at 310,000 units, with an average price of \$1,050, a single-line production capacity of 350,000 units, and a gross profit margin of 85%.
