A depth filtration system is a filtration process that involves passing a fluid through a porous medium, typically a thick layer of filter material, to capture and remove contaminants. Unlike surface filtration, where particles are primarily trapped on the surface of the filter medium, depth filtration allows particles to penetrate and be retained throughout the depth of the filter material. This results in a higher dirt-holding capacity and greater efficiency in removing a wide range of contaminants, including particles, sediments, and microorganisms, from liquids or gases.

The global Depth Filtration System market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
