## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A desiccant rotor (desiccant wheel) is very similar to a thermal wheel, but with a coating applied for the sole purpose of dehumidifying, or 'drying', the air stream. The desiccant is normally silica gel. As the wheel turns, the desiccant passes alternately through the incoming air, where the moisture is adsorbed, and through a “regenerating” zone, where the desiccant is dried and the moisture expelled. The wheel continues to rotate, and the adsorbent process is repeated. Regeneration is normally carried out by the use of a heating coil, such as a water or steam coil, or a direct-fired gas burner.

Thermal wheels and desiccant wheels are often used in series configuration to provide the required dehumidification as well as recovering the heat from the regeneration cycle.
