The global Desktop Electronic Spirometer market size is predicted to grow from US\$ 704 million in 2025 to US\$ 1073 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

A desktop electronic spirometer is a medical device designed for measuring and assessing lung function through a diagnostic test called spirometry. Spirometry involves the measurement of the volume and flow of air during inhalation and exhalation. Desktop electronic spirometers are typically used in clinical settings, hospitals, or medical offices, and they offer a more comprehensive set of features compared to portable or handheld spirometers.

Desktop electronic spirometers have been increasingly designed to integrate with digital health platforms and electronic health records (EHR) systems. This integration allows for seamless data transfer, remote monitoring, and comprehensive patient management.
