A desktop wireless boundary microphone is a microphone device specifically designed to be placed on flat surfaces such as desktops, utilizing the boundary effect to achieve high-quality audio acquisition and transmitting audio signals wirelessly. When the microphone is positioned near an acoustic boundary (such as a desktop, ceiling, or other surface), sound produces reflections and interferences on the boundary, enabling the microphone to more effectively capture sound within a specific area while reducing interference from ambient noise. It typically features a compact, flat design to ensure stable placement on flat surfaces like desktops, without occupying too much space and causing no interference with desktop activities.
