Dexamethasone for COVID-19 is a corticosteroid hormone drug. Hormones are so-called long-distance chemical messengers. These types of hormones are released from glands found on the kidneys that are known as adrenal glands. The adrenal glands mediate stress response with the production of these corticosteroid messengers. Dexamethasone is a synthetic source of corticosteroid hormones. When taken, Dexamethasone will enter the bloodstream and perform similar regulatory tasks as natural corticosteroids, namely decrease the immune response, and reduce inflammation/swelling/allergic-type reactions. The severe inflammation of vital organs caused by the body's response to COVID-19 seems to be the leading cause of coronavirus deaths. Dexamethasone can reduce risk of dying in critically ill patients.
