The global Dextrose Anhydrous market size is predicted to grow from US\$ 1047 million in 2025 to US\$ 1337 million in 2031; it is expected to grow at a CAGR of 4.1% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Dextrose Anhydrous is a form of glucose made from starch of corn. Just like sugar, it is sweet in nature but contain around 20% less sweetness as compared to sugar made from sugarcane. Dextrose Anhydrous does not contain any water, produced in crystalline or powder form. Dextrose, like fructose and glucose, is a monosaccharide also known as simple sugar. Simple sugars can be combined to produce complex sugars such as sucrose. Human body metabolizes each unit of simple sugar whereas complex sugars are not easily metabolized by body. Dextrose Anhydrous is widely used as a nutrition supplement and a sweetener in food production. Apart from food, it is also used in beverage, animal feed, pharmaceutical and various other industries.

Market Concentration and Key Players:

Internationally, the market concentration of anhydrous glucose is relatively high, mainly concentrated in Europe and America and other developed countries. For example, Thermo Fisher Scientific, Cargil and other large manufacturers; from the domestic point of view, the market concentration of anhydrous glucose is relatively high, mainly produced by Shengtai Group, Yufeng Industrial and other enterprises.

Manufacturing Processes and Market Trends:

The manufacturing process of anhydrous glucose takes starch as raw material and is realized through the steps of hydrolysis, refining, crystallization and the like. The method comprises the following steps of: firstly, converting starch into glucose syrup by acidolysis or enzymolysis; then, decolorizing by active carbon and desalting by ion exchange resin to remove impurities; and removing bound water by vacuum concentration and high-temperature crystallization processes to finally obtain white crystalline powder with the water content of less than 1%. The process requires strict control of crystallization conditions to ensure product purity and stability, while avoiding hygroscopic caking. For example, China sugar capital manufacturers adopt bioengineering conversion technology to convert corn starch into high-purity glucose syrup with high efficiency, and optimize particle morphology through multi-stage crystallization system to meet pharmaceutical grade injection standards.

In terms of market trends, the demand in the pharmaceutical sector continues to grow, especially for injection-grade products in biopharmaceutical and intravenous infusion applications. Raw material costs and energy consumption remain constraints for China as a major producer. In the food industry, the trend towards healthy consumption is driving increased penetration of anhydrous glucose in low-sugar bakery, functional beverages. Emerging applications in the industrial field further broaden the market space, in which the demand of electroplating industry is increasing at the fastest rate.
