Dextrose is also called as glucose as they are chemically identical. It plays a vital role in providing energy to body cells. Dextrose Injection is a non-pyrogenic and sterile solution for caloric supply and fluid replenishment by a single dose. Route of administration of dextrose injection is intravenous i.e. into the vein. Dosage of dextrose injection depends upon weight, age, and clinical condition of the patient. Dextrose 5% in water is injected into the vein to replace lost fluids and also provide carbohydrates to the body. Dextrose 5% in water is also used to treat hypoglycemia (low blood sugar), insulin shock and dehydration (fluid loss). Dextrose is a carbohydrate which is a part of nutrition. Dextrose solution along with amino acids and fats provide nutrition the body. This is called as total parental nutrition. Hyperkalemia is a condition in which potassium levels are high. Dextrose solution (50%) is administered to person suffering from hyperkalemia.
