The global Di-n-octyl Succinate market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Diocetyl succinate is a fatty acid ester that is used as an absorption enhancer. It has been shown to be safe in clinical trials and is not associated with any significant toxicity. Diocetyl succinate enhances the absorption of drugs by increasing the lipid content in the gastrointestinal tract, thereby promoting better absorption. This compound also increases drug solubility and reduces gastrointestinal irritation. Diocetyl succinate is amphiphilic, which means that it can act as a cationic surfactant to enhance the solubility of drugs in water. The hydroxyl group on diocetyl succinate interacts with potassium dichromate, which results in the formation of potassium ethylene diamine (KED). KED has been shown to have cytotoxic effects on human erythrocytes and can induce hemolysis when administered to rats at high doses.

United States market for Di-n-octyl Succinate is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
