Diabetes type 1 and type 2 are one of the most common chronic diseases prevalent in the world, affecting millions of people. One of the disorders associated with diabetes type 1 and type 2 is gastroparesis, which is characterized by the delayed emptying of the stomach. One of the major causes of gastroparesis is damage to the vagus nerve, reducing the mobility of the stomach contents. Diabetic neuropathy affects the vagus nerve, in cases where the blood glucose levels remain high over a longer duration. Diabetes gastroparesis is usually diagnosed with the help of imaging techniques such as ultrasound and x-ray, which is accompanied by the intake of radio isotopic meals containing barium, or using hematological / blood tests, and endoscopic techniques. There has been a marked increase in the prevalence of diabetes, especially in the developing countries, including China, India, Brazil, and some other Asian countries, leading to increasing incidence of diabetic neuropathy and consequent rise in diabetes gastroparesis around the world.
