Diabetic retinopathy (DR) represents a major cause of visual impairment in developed countries. The ever-growing incidence of DR and its complications necessitates new strategies to screen patients, prevent complications and optimize management. For this reason, DR is a major target of AI-based models, especially those that can be used for large-scale screening. AI models should recognize DR-related alterations, such as haemorrhages, exudates, cotton wool spots and neovascularization; and, starting from fundus images, establish the presence or absence of DR, and grade it according to the conventional DR grading scales.

The global Diabetic Retinopathy (DR) Artificial Intelligence Screening System market size is projected to grow from US\$ 166 million in 2024 to US\$ 7331 million in 2030; it is expected to grow at a CAGR of 88.0% from 2024 to 2030.
