Diagnostic catheter is a thin flexible tube that is inserted into the target site, be it veins, arteries, or uterine cavity for the diagnostic purpose. It also allows injection of radio-opaque dye to the target site for the interventional diagnostic purpose. Diagnostic catheters are used for different conditions related to neurology, cardiology, urology, gastroenterology, and pulmonary or reproductive health. Diagnostic catheters are most commonly used in angiographic procedures. They are used for the diagnosis of various cardiovascular diseases (CVDs), especially cardiac arrhythmias. Cardiac arrhythmia is mainly of three types: atrial fibrillation, atrial flutter, and supraventricular tachycardia. Atrial fibrillation is one of the most common types of cardiac arrhythmia prevalent among the population globally. The diagnostic catheter delivers a radiopaque media or a therapeutic agent to the target site in the vascular system. It also leads a guidewire or a catheter to the target site.
