## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Diamide insecticides, have different class of insecticides, which works on a novel mode of action by selectively activating the insect or pest ryanodine receptor. They are predominantly active against lepidopteran pests of cruciferous crops. However, within a comparatively shorter period succeeding their commercialisation, a relatively large number of control disappointments have been reported in the field. These diamides are the recent addition to the restricted number of insecticide classes with precise target site activity that are extremely efficacious, regulate a wide pest spectrum, and have a favourable toxicological outline profile.
