The diamond air flow crusher generates a high-speed rotating or jetting airflow to suck the diamond material into the crushing chamber. In the crushing chamber, the material is impacted, collided and rubbed by the high-speed airflow, so as to achieve the purpose of crushing the coarse and uneven materials into powder. Finally, the crushed material is collected and discharged through a specific discharge system (such as an exhaust port or a dust collector). Diamond air flow crusher is widely used in occasions that require high-precision and high-efficiency crushing, such as the processing of superhard materials such as diamond. In addition, it is also widely used in chemical, pharmaceutical, food and other industries.

The global Diamond Air Flow Crusher market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
