Catalyst powder is a metal powder used to artificially synthesize diamond. The hardness of diamond is very high. If you want to change the performance of diamond, you need to increase its temperature. This is the role of catalyst. Without the participation of catalysts, the conversion of graphite to diamond requires a high pressure of 13 GPa and a high temperature of 2700 °C or more. After adding the catalyst, the pressure and temperature of diamond synthesis can be reduced to 5~6

GPa and 1200~1400 °C respectively, so the diamond catalyst powder is very important in the process of diamond synthesis.
