Chip attach carrier substrate refers to the substrate used to attach chips (such as integrated circuit chips) to it. In the electronic manufacturing process, the die attach carrier substrate plays the role of fixing and supporting the chip. Die-attach carrier substrates are usually made of conductive materials such as metals or conductive polymers. It has good electrical and thermal conductivity, which can provide stable electrical connection and heat dissipation. During the die attach process, the die is precisely placed on the carrier substrate and fixed using an appropriate adhesive or soldering process. The carrier substrate may also contain circuit connectors, pins, or other electronic components for connection and integration with other components. The

design and manufacture of die-attached carrier substrates need to consider factors such as chip size, pin layout, and heat dissipation requirements. It plays an important role in the manufacture of electronic devices, ensuring the stability, reliability and performance of chips.
