The report requires updating with new data and is sent in 48 hours after order is placed.

According to our LPI (LP Information) latest study, the global Dielectric Elastomers market size was valued at US\$ million in 2023. With growing demand in downstream market, the Dielectric Elastomers is forecast to a readjusted size of US\$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Dielectric Elastomers market. Dielectric Elastomers are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Dielectric Elastomers. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Dielectric Elastomers market.

Dielectric elastomers are made of a highly stretchable elastomeric film (mostly Silicone Rubber Elastomer, Acrylate Elastomer or Polyurethane Elastomer) as a dielectric, which is coated on both sides with highly flexible electrodes of graphite or carbon black.

Dielectric elastomers (DEs) are smart material systems that produce large strains. They belong to the group of electroactive polymers (EAP). DE actuators (DEA) transform electric energy into mechanical work. They are lightweight and have a high elastic energy density. They have been investigated since the late 1990s. Many prototype applications exist.

The dielectric elastomer consists of a polymer flexible film sandwiched between upper and lower layers of flexible electrodes, developed and developed by SRI International, a non-profit international research organization, in the second half of 1991. In the external

electrical stimulation, the dielectric elastomer can change the shape or volume; when the external electrical stimulation is removed, the dielectric elastomer can restore to the original shape or volume, resulting in stress and strain to convert electrical energy into mechanical energy.

Dielectric elastomers are characterized by large electrical deformation, high energy density, fast response, low viscoelastic hysteresis (mechanical) loss, and high conversion efficiency. They are mainly used for the production of lightweight, miniaturized and high-precision actuators. Potential of an intelligent material. Dielectric elastomer actuator principle was first proposed by Wilhelm Conrad Röntgen in 1880, the voltage applied to the electrode 2, the resulting two-electrode charge between the opposite sex electrostatic attraction in the direction of film thickness of the elastic film; In the horizontal direction, the electrostatic repulsion of the same-sex charge expands the film on the single-sided electrode, resulting in variations in thickness and area: the thickness decreases and the area expands.

Dielectric elastomers and inherently conductive polymers (ICP), inherently dissipative polymers, conductive plastics and ferroelectrets adds up to total electroactive polymers market. The electroactive polymers (EAP) are part of the broad group of smart materials. The use of polymers with electroactive response has only emerged in the last decade with the introduction of new materials which have significant displacement levels. These materials are highly attractive for their low-density, large strain capability, superior spectral response and resilience. In general, the biggest advantages over conventionally used systems in most application fields are the intermittent displacement they can provide, an adaptable stiffness combined with variable size and form factors from micrometres to metres.

Festo and The Soft Robotics Toolkit are the top two manufacturers of Dielectric Elastomers, with about 23% market shares.
