The dielectric film mirror is an optical element that uses a dielectric film as a reflective layer. Different from metal film mirrors, dielectric film mirrors realize the reflection and transmission of light by depositing multiple layers of dielectric films on the base material, so that the light is reflected and transmitted multiple times between the films to form the required reflection characteristics.

The dielectric film mirror is composed of a base material and a multi-layer dielectric film, and has the characteristics of high reflectivity, wavelength selectivity, total reflection, and low absorption. Select the appropriate dielectric material and multilayer structure according to the specific application requirements to achieve the desired optical performance and wavelength range.
