A diesel-driven articulated boom lift is a specialized mechanical device that uses a diesel engine as its power source. It is driven by a hydraulic or other transmission system to enable the articulated boom structure to perform lifting, extending, and other movements, thereby transporting operators and equipment to high-altitude work positions. It features robust power, excellent off-road performance, and independence from external power supply restrictions, making it suitable for complex operating environments in the wild and where external power is unavailable. The equipment is mainly composed of parts such as a diesel engine, output shaft, reducer, pinion gear, fixed large gear ring, and hydraulic system.
