The global Diethyl Carbonate for Lithium-Ion Battery market size is predicted to grow from US\$ 214 million in 2025 to US\$ 309 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

In 2025, global Diethyl Carbonate for Lithium-Ion Battery production reached approximately 199 kilotons with an average global market price of around US\$ 1,100 per ton, and a gross profit margin of approximately 20%-40%. Diethyl Carbonate (DEC) for lithium-ion batteries refers to electrolyte-grade diethyl carbonate, a linear organic carbonate solvent manufactured and purified to very tight impurity limits so it can be safely used inside Li-ion cells. Its primary role is to act as part of the electrolyte solvent system that dissolves lithium salts (most commonly LiPF₆ in conventional electrolytes) and enables Li⁺ ions to move efficiently between the anode and cathode during charge and discharge. DEC is rarely used alone, it is typically blended with ethylene carbonate (EC) and other linear carbonates such as dimethyl carbonate (DMC) and/or ethyl methyl carbonate (EMC) to balance key properties including viscosity, ionic conductivity, electrode/separator wettability, low-temperature power, and manufacturability (filling and soaking behavior). What distinguishes “for lithium-ion battery” DEC from industrial grades is the requirement for ultra-low moisture, low acidity, and extremely low levels of halides and trace metals (e.g., Na, K, Ca, Mg, Fe), because these contaminants can accelerate LiPF₆ hydrolysis, generate HF, corrode current collectors, disrupt SEI/CEI formation, increase gassing, and drive impedance growth and capacity fade.

United States market for Diethyl Carbonate for Lithium-Ion Battery is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
