## Abstracts

The global Differential Pressure Controller market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A differential pressure controller is a device used to monitor and control the differential pressure of a liquid or gas in a system. It usually consists of sensors, control modules and actuators to maintain the differential pressure between two points in the system within a set range.

The differential pressure controller includes: the sensor measures the differential pressure, the control module processes the signal, the controller adjusts the actuator, and maintains the differential pressure within the set range. By using the differential pressure controller, the precise control and adjustment of the differential pressure in the system can be realized, thereby improving the stability, efficiency and reliability of the system.
