Abstracts

The global Differential Receiver market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A differential receiver is a receiver commonly used in communication systems to receive and demodulate differential signals. The differential signal is composed of two independent signals with the same characteristics, and the differential receiver can effectively suppress common mode noise and have stronger anti-interference ability.

The input of the differential receiver is a differential signal, and the circuit structure can effectively suppress common-mode noise and demodulate the differential signal. The advantages of differential receivers: strong anti-interference, improved signal integrity, reduced bit error rate, suitable for high frequency signals. The differential receiver improves the anti-interference ability and reliability of the signal through differential input and common-mode noise suppression characteristics, and is suitable for the reception and demodulation of various high-frequency signals.
