A differential video amplifier is an amplifier designed to amplify differential signals. A differential signal refers to a signal composed of two signals that are opposite to each other, and the difference between them is amplified by an amplifier and used as an output signal. In video processing applications, differential video amplifiers are often used to amplify differential signals, such as those between adjacent pixels, which can improve the signal-to-noise ratio and dynamic range of the video signal. A differential

video amplifier is usually implemented using a high-speed operational amplifier. Its circuit structure is similar to that of an ordinary operational amplifier, but it has two input ports that receive two components of the differential signal. The differential video amplifier can also achieve different amplification effects by adjusting the gain and bias voltage of the amplifier. For example, the gain of the amplifier can adjust the dynamic range of the video signal, and the bias voltage can adjust the center point of the video signal. In addition, differential video amplifiers can use passive components such as capacitors and resistors for functions such as filtering and matching. Differential video amplifiers are widely used in video processing, image processing, audio processing, sensor signal processing and other fields.
