Diffuse reflection fiber optic probe is an optical sensor device used to detect diffuse reflection light signals on the surface of an object through the combination of fiber optic and probe. It usually consists of fiber bundles, probes, and receivers. The working principle of a diffuse reflection fiber optic probe is to transmit a beam of light to the end of the probe through an optical fiber. After the probe comes into contact with the surface

of the measured object, the incident light will undergo diffuse reflection on the surface of the object. Diffuse reflection is the phenomenon of light scattering in an isotropic manner on an object surface, and its reflection angle is independent of the incident angle. The diffuse reflection light signal will be transmitted back to the optical fiber and received and analyzed by the receiver. Diffuse reflection fiber optic probes have a wide range of applications, including surface detection and measurement. Diffuse reflection fiber optic probes can be used for detecting and measuring parameters such as surface roughness, color, reflectivity, etc. It can non-contact obtain diffuse reflected light signals on the surface of an object, and determine the properties and features of the surface by analyzing signal features. Component analysis: Diffuse reflection fiber optic probes combined with appropriate spectral analysis techniques can be used for the analysis and detection of surface components of objects. Different materials have unique characteristics in diffuse reflectance spectroscopy, and spectral analysis can determine the chemical composition and material characteristics of the surface of an object. Process monitoring: Diffuse reflection fiber optic probes can be used for real-time monitoring and control in industrial processes. For example, in the processes of coating, spraying, liquid level detection, etc., the probe can be used to detect parameters such as the uniformity of the coating and the degree of liquid infiltration, in order to achieve process optimization and quality control. Biomedical applications: Diffuse reflection fiber optic probes are also used in the biomedical field, such as skin tissue analysis, blood component detection, etc. It can provide non-invasive detection methods for disease diagnosis, physiological monitoring, and other aspects. In summary, the diffuse reflection fiber optic probe can achieve detection, measurement, and monitoring tasks in various application scenarios by utilizing the diffuse reflection light signal on the surface of an object, and has broad application prospects.
