Digital anti-fatigue lenses refer to functional optical lenses designed for modern people who use electronic devices (such as computers, mobile phones, and tablets) for a long time, aiming to relieve the eye's adjustment fatigue caused by frequent focusing on close-range targets. This type of lens is usually based on traditional single-vision lenses, with a slight 'light-adding' design (generally +0.3D to +0.6D) added to the area below the lens to reduce the pressure of the ciliary muscle from continuous work, thereby relieving digital visual fatigue symptoms such as eye soreness, eye dryness, and blurred vision caused by long-term close-range eye use. Digital anti-fatigue lenses are suitable for users such as teenagers, office workers, and students who use digital devices for a long time, especially for young people who have not yet developed presbyopia but have already experienced visual fatigue. It combines digital free-form surface cutting technology, precise optical calculation, and functional coatings such as blue light filtering and anti-reflection, which not only improves visual clarity and comfort, but also helps users maintain visual health and improve daily work and learning efficiency.
